On the horizontal plane the accelerating force is jo , $= -fg - 0,03. 32,2 = 0,966$ feet j hence, the 243. Rolling motion.--When a carriage rolls down an inclined plane, the friction of the axle chiefly acts in opposition to the accelerating force; if r be the radius of the axle, and a that of the wheel, the friction will amount to $-N = -G \cos. a$, and hence a the accelerating force $p = (\sin. a - \cos. a) G$. If a round body AB, a cylinder or sphere, for example, roll Fig. 299. down an inclined plane FH, Fig. 299, we have to consider a progressive and a rotatory motion at the same time. Generally the acceleration of the progression is equal to that of the rotation (156); since if we put the moment of inertia of the rolling body = $G y$, and the radius of the cylinder = o , we shall then obtain for the force $AK = K$, with which the cylinder is set into revolution by virtue of the penetration of its Gv parts into those of the inclined plane: $K = p$.--. But the force $r r g a K$ acts opposed to the force for descent $G \sin. a$, hence it follows that the moving force for progressive motion = $G \sin. a - K$, . $G \sin. a - K$ and the accelerating force...
